ELECTROMECHANICAL CYLINDER PLUG

THIRD (3rd) SUPPLEMENTAL AMENDMENT

Assistant Commissioner for Patents Washington, D.C. 20231

Sir:

Supplemental to Applicant's earlier filed three Amendments of 5 August 1998, 17 September 1998, and 13 October 1998, in response to the second, non-final Office action (Paper No. 10) dated 5 February 1998, the following amendments and remarks are respectfully submitted.

Folio: P53821C Date: 10/23/98 I.D.: REB/kf

COPY

IN THE CLAIMS

Please amend Claims 1, 4 and 6, and add Claims 14 through 24, as follows:

1. (Twice Amended) A plug, comprising:

a first base bearing a keyway providing a first electrical conductor and an orifice spaced-apart from and separated by a mass of said plug from said keyway;

a second base separated by an axial length of said plug from said first base, said second base bearing means for supporting a cam, said mass being perforated by a plurality of radially oriented apertures forming [a linear arrays] an array;

an exterior surface extending between and engaging said first base and said second base;

a sidebar positioned between said first base and said second base to reciprocate between a first location with said sidebar simultaneously engaging said plug and a cylinder surrounding said plug, and a second location releasing said plug for rotation relative to the cylinder;

locking means disposed within said apertures to reciprocate relative to said plug in response to a key inserted into said keyway to accommodate reciprocation of said sidebar relative to said plug and rotation of said plug relative to [a] the cylinder [surrounding said plug] when the key while inserted into said keyway engages in a selected relation with said locking means, and [engaging the cylinder] obstructing said reciprocation absent said selected relation;

a second electrical conductor terminating with an electrical contact exposed to an exterior of said first base through said orifice;

an electronic logic circuit borne by said plug while coupled to receive electrical power and data signals via said first and second electrical conductors, and generating control signals in dependence upon said electrical power and data signals; and

an electrical operator disposed within one of said apertures, said operator having a distal member travelling in dependence upon said control signals between a first position relative to said exterior surface [enabling rotation of] accommodating said [plug in relation to a cylinder surrounding said plug] reciprocation and a second and different position relative to said exterior surface obstructing said [rotation of said plug in relation the cylinder] reciprocation.

- 4. (Amended) The plug of claim 1, with said electrical operator maintaining said distal member within said plug with said distal member extended not beyond said exterior surface while said distal member is in said first position, and maintaining said [distal member] sidebar in concurrent engagement with said plug and with the cylinder while said distal member is in said second position.
 - 6. (Twice Amended) A lock, comprising:

- a cylinder containing a hollow recess defining a longitudinal axis;
- a plug bearing a plurality of open radially oriented apertures forming [a linear] an array, said plug being rotatable around said longitudinal axis while resident within said hollow recess, said plug comprising:
 - a first base bearing a keyway providing a first electrical conductor and an

7	orifice spaced-apart from and separated by a mass of said plug from said keyway;
. 8	a second base separated by an axial length of said plug from said first base,
9	said second base bearing means for supporting a cam;
10	an exterior surface extending between and engaging said first base and said
11	second base;
12 ⁻	a sidebar positioned between said first base and said second base to reciprocate
13	between a first location with said sidebar simultaneously engaging said plug and said cylinder
14	surrounding said plug, and a second location releasing said plug for rotation relative to the cylinder;
15	locking means disposed within said apertures to reciprocate relative to said
16	cylinder in response to a key inserted into said keyway to accommodate reciprocation of said
17	sidebar relative to [rotation of] said plug relative to [a] said cylinder [surrounding said plug]
18	when the key while inserted into said keyway engages in a selected relation with said locking
19	means and [engaging the cylinder] obstructing said reciprocation absent said selected
20	relation;
21	a second electrical conductor terminating with an electrical contact exposed
22	to an exterior of said first base through said orifice;
23	an electronic logic circuit borne by said plug, coupled to receive electrical
24	power and data signals via said first and second electrical conductors, and generating control
25	signals in dependence upon said electrical power and data signals; and
26	an electrical operator borne by said plug, disposed within one of said
27	apertures, said operator having a distal member radially reciprocating along an axis

transverse to said longitudinal axis, in dependence upon said control signals between a first position relative to said exterior surface [enabling said rotation of] accommodating said [plug in relation to said cylinder surrounding said plug] reciprocation and a second and different position relative to said exterior surface obstructing in concert with said locking means, said [rotation of said plug in relation said cylinder] reciprocation.

a cylinder containing a hollow interior recess defining a longitudinal axis, and bearing a slot within said recess; and

a plug rotatable from a rest orientation around said longitudinal axis while resident within said hollow recess relative to said cylinder; and

a bar positioned between said first end and second end while extending into said slot, and providing simultaneous engagement of said cylinder and said plug while said cylinder remains in said rest orientation;

said plug comprising:

a first base bearing a keyway providing a first electrical conductor and an orifice spaced-apart from and separated by a mass of said plug from said keyway;

a second base separated by an axial length of said plug from said first base, said second base disposed to support a cam, said mass being perforated by a radially oriented aperture;

an exterior surface extending between said first base and said second base;

retaining means oriented to retain a shank of a key inserted into said keyway while said plug remains in an orientation other than said rest orientation relative to said cylinder, and to accommodate withdrawal of the key from said keyway while said plug is in said rest orientation;

a second electrical conductor terminating with an electrical contact exposed to an exterior of said first base through said orifice;

an electronic logic circuit comprising a memory storing a code, said circuit being borne by said plug and coupled to receive electrical power and data signals via said first and second electrical conductors, said circuit generating control signals in dependence upon correspondence between said code and information borne by said data signals; and

an electrical operator borne by said plug, said operator having a distal member travelling in dependence upon said control signals between a first position relative to said exterior surface maintaining said simultaneous engagement and a second and different position relative to said exterior surface accommodating movement between said plug and said cylinder.

--15. The lock of claim 14, further comprising:

said bar comprising a sidebar positioned between said first base and said second base to reciprocate between a first location while providing said said simultaneous engagement, and a second location releasing said plug for rotation relative to said cylinder; and

said distal member being oriented within said plug to move relative to said plug to

accommodate reciprocation of said sidebar relative to said plug and rotation of said plug from said rest orientation relative to the cylinder when a key while inserted into said keyway generates said data signals representing information having a selected said correspondence with said code, and obstructing said reciprocation absent said selected correspondence.

--16. The lock of claim 14, further comprising:

said bar comprising an arm arcuately engaging said cylinder and a detent extending from said arm and through said slot; and

said distal member being oriented within said plug to move relative to said plug to accommodate passage of said detent relative to said distal member during rotation of said plug from said rest orientation relative to the cylinder when a key while inserted into said keyway generates said data signals representing information having a selected said correspondence with said code, and obstructing said rotation of said plug from said rest orientation by engaging said detent absent said selected correspondence.

--17. The lock of claim 14, further comprising:

said bar comprising an arm arcuately engaging said cylinder and a detent extending from said arm and through said slot; and

said distal member being oriented within said plug to move relative to said plug to accommodate passage of said detent relative to said distal member during rotation of said plug from said rest orientation relative to the cylinder when a key while inserted into said keyway generates

said data signals representing information having a selected said correspondence with said code, obstructing said rotation of said plug from said rest orientation by engaging said detent absent said selected correspondence, and accommodating passage of said detent relative to said distal member during rotation of said plug from an orientation other than said rest orientation to said rest orientation.

--18. The lock of claim 14, further comprising:

said bar comprising an arm arcuately engaging said cylinder and a detent extending from said arm and through said slot; and

said distal member being oriented within said plug to move relative to said plug to accommodate passage of said detent relative to said distal member during rotation of said plug from said rest orientation relative to the cylinder when a key while inserted into said keyway generates said data signals representing information having a selected said correspondence with said code, and obstructing said rotation of said plug from said rest orientation by engaging said detent absent said selected correspondence when said rotation is in a first direction, and accommodating said rotation of said plug from said rest orientation despite an absence of said selected correspondence when said rotation is in a second and opposite direction.

--19. The lock of claim 14, further comprising:

said bar comprising an arm arcuately engaging said cylinder and a detent extending from said arm and through said slot; and

said distal member being oriented within said plug in an engagement of said detent to obstruct said rotation of said plug from said rest orientation, and to move relative to said plug from said engagement of said detent obstructing said rotation of said plug from said rest orientation to an accommodation of passage of said detent relative to said distal member during rotation of said plug from said rest orientation relative to the cylinder when a key while inserted into said keyway generates said data signals representing information having a selected said correspondence with said code, and continuing said accommodation despite intermittent removal of the key from said keyway.

--20. The lock of claim 14, further comprising:

6 .

said bar comprising an arm arcuately engaging said cylinder and a detent extending from said arm and through said slot; and

said distal member being oriented within said plug in an engagement of said detent to obstruct said rotation of said plug from said rest orientation, and to move relative to said plug from said engagement of said detent obstructing said rotation of said plug from said rest orientation to an accommodation of passage of said detent relative to said distal member during rotation of said plug from said rest orientation relative to the cylinder when a key while inserted into said keyway generates said data signals representing information having a selected said correspondence with said code, and continuing said accommodation despite intermittent removal of the key from said keyway absent subsequent said generation of data signals representing information having said selected correspondence with said code.

--21. The lock of claim 16, further comprising:

a sidebar positioned between said first base and said second base to provide reciprocation between a first location with said sidebar providing simultaneous engagement with said plug and said cylinder, and a second location releasing said plug for rotation relative to the cylinder; and

an electrical solenoid borne by said plug, said solenoid having a distal armature travelling in dependence upon said control signals between a third position relative to said exterior surface maintaining said simultaneous engagement and a fourth and different position relative to said exterior surface accommodating said reciprocation.

--22. The lock of claim 17, further comprising:

a sidebar positioned between said first base and said second base to provide reciprocation between a first location with said sidebar providing simultaneous engagement with said plug and said cylinder, and a second location releasing said plug for rotation relative to the cylinder; and

an electrical solenoid borne by said plug, said solenoid having a distal armature travelling in dependence upon said control signals between a third position relative to said exterior surface maintaining said simultaneous engagement and a fourth and different position relative to said exterior surface accommodating said reciprocation.

--23. The lock of claim 18, further comprising:

a sidebar positioned between said first base and said second base to provide reciprocation between a first location with said sidebar providing simultaneous engagement with said plug and said cylinder, and a second location releasing said plug for rotation relative to the cylinder; and

an electrical solenoid borne by said plug, said solenoid having a distal armature travelling in dependence upon said control signals between a third position relative to said exterior surface maintaining said simultaneous engagement and a fourth and different position relative to said exterior surface accommodating said reciprocation.

--24. The lock of claim 19, further comprising:

. 1

a sidebar positioned between said first base and said second base to provide reciprocation between a first location with said sidebar providing simultaneous engagement with said plug and said cylinder, and a second location releasing said plug for rotation relative to the cylinder; and

an electrical solenoid borne by said plug, said solenoid having a distal armature travelling in dependence upon said control signals between a third position relative to said exterior surface maintaining said simultaneous engagement and a fourth and different position relative to said exterior surface accommodating said reciprocation.

REMARKS

Claims 1 through 24 are pending in this application. Claims 1, 4, and 6 have been amended in various particulars to conform to the elected species, while claims 14 through 24, directed to both the elected species and to other species, are newly added in order to expedite this compacted prosecution. These claims are deemed to be allowable for the reasons set forth in Applicant's earlier filed response.

Gokcebay '777 uses a solenoid operator analogous to the embodiment set forth in Applicant's non-elected Fig. 8H; in contradistinction, the amended and newly added claims are directed to species shown *inter alia*, by Figs. 1 through 8G. The Examiner has already determined that the species of Fig. 8H is patentably distinct "from the others due to different elements being shown by the figures." In view of the fact that the Examiner has made the requirement for election of species final, Dokcebay '777 has no relevant to the patentability of the pending claims.

In view of the foregoing amendments, arguments and remarks, all claims are deemed to be allowable and this application is believed to be in condition to be passed to issue. Should any questions remain unresolved, the Examiner is requested to telephone Applicant's attorney.

A fee of \$85.00 is incurred by the addition of one (1) independent claim in excess of 3 and four (4) claims in excess of 20. Applicant's check drawn to the order of Commissioner accompanies this Response. Should the check become lost, should other fees be incurred, the Commissioner is authorized to charge Deposit Account No. 02-4943 of Applicant's undersigned attorney in the amount of such fees.

Respectfully submitted,

Robert E. Bushnell,

Attorney for the Applicant Registration No.: 27,774
